PROTOZOA

<u>Definition</u> 'Protozoa may be defined as 'microscopic acellular animalcules existing singly or in colonies, without tissue and organs, having one or more nuclei'

Characters

- 1. There are about 50,000 known species of Phylum Protozoa.
- 2. Protozoans exhibit mainly two forms of life; **free-living** (aquatic, freshwater, seawater) and **parasitic** (ectoparasites or endoparasites). They are also **commensal** in habitat.
- 3. They are **small**, usually **microscopic**, not visualize without a microscope.
- 4. They are the **simplest** and **primitive** of all animals.
- 5. They have a simple body organization. i.e. with a **protoplasmic grade** of organization.
- 6. The body is **unicellular** (without tissue and organs).
- 7. They have one or more **nuclei** which are monomorphic or dimorphic.
- 8. Body **naked** or bounded by a **pellicle**, but in some forms may be covered with shells and often provided with an internal skeleton.
- 9. They are **solitary** (existing alone/single) or **colonial** (individuals are alike and independent).
- 10. Body **shape variables** may be spherical, oval, elongated or flattened.
- 11. Body symmetry either none or bilateral or radial or spherical.
- 12. Body form usually **constant**, varied in some, while changing with environment or age in many.
- 13. Body protoplasm is differentiated into an outer **ectoplasm** and inner **endoplasm**.
- 14. The single-cell body performs all the essential and vital activities, which characterize the animal body; hence only **subcellular physiological division of labor**.
- 15. Locomotory organs are fingers like **pseudopodia**, whip-like **flagella**, hair-like **cilia** or none.
- 16. Nutrition may be **holozoic** (animal-like), **holophytic** (plant-like), **saprozoic** or **parasitic**.
- 17. Digestion occurs **intracellularly** which takes place inside the food vacuoles.
- 18. Respiration occurs by **diffusion** through the general body surface.
- 19. Excretion occurs through the **general body surface**, but in some forms through a temporary opening in the ectoplasm or through a permanent pore called **cytopyge**.
- 20. Contractile vacuoles perform **osmoregulation** in freshwater forms and also help in removing excretory products.
- 21. Reproduction **asexual** (binary or multiple fission, budding, sporulation) or **sexual** (conjugation (hologamy), game formation (syngamy)).
- 22. The life cycle often complicated with alternation of asexual and sexual phases (alternation of generation).
- 23. **Encystment** commonly occurs to resist unfavorable conditions of food, temperature, and moisture, and also helps in dispersal.
- 24. The single-celled individual not differentiated into somatoplasm and germplasm; therefore, exempt from natural death which is the price paid for the body.
- 25. Protozoans exhibit mainly two forms of life; **free-living** (aquatic, freshwater, seawater) and **parasitic** (ectoparasites or endoparasites). They are also **commensal** in habitat.

26. Examples: Euglena, Amoeba, Plasmodium, Paramecium, Podophyra, etc.

Classification:

It divides protozoa into four subphyla.

Subphylum I: Sarcomastigophora Subphylum II: Sporozoa Subphylum III: Cnidospora Subphylum IV: Ciliophora

Subphylum I: Sarcomastigophora

- Locomotor organelles are pseudopodia or flagella.
- The nucleus is of a single type (monomorphic).
- There is no spore formation.
- Syngamy occurs in reproduction.

Superclass A: Mastogophora

- They are commonly called flagellates.
- Locomotory organelles are flagella in adults.
- The body is covered by a pellicle.
- Binary fission is longitudinal.
- They are mostly free-living though some are parasitic.
- Nutrition is autotrophic or heterotrophic or both.

Class 1: Phytomastigophorea

- Chlorophyll-bearing chromatophores present.
- Nutrition mainly holophytic by phototrophy.
- Reserve food is starch or paramylon.
- They have usually only one or two flagella.
- The nucleus is vesicular.

Order 1: Chrysomonadina.

Examples: *Chromulina, Ochromonas, Dinobryon, Synura, Chrysamoeba*, etc. Order 2: Coccolithophorida.

Examples: Coccolithus, Rhabdosphaera, etc.

Order 3: Heterochloride.

Examples: Heterochloris, Myxochloris, etc.

Order 4: Cryptomonadida.

Examples: Chilomonas, Cryptomonas, etc.

Order 5: Dinoflagellida.

Examples: Noctiluca, Ceratium, etc.

Order 6: Euglenida.

Examples: Euglena, Phacus, Copromonas, Peranema, etc.

Order 7: Volvocida (Phytomonadida).

Examples: Volvox, Chlamydomonas, Eudorina, etc. Order 8: Chloromonadida. Examples: Vacularia, Coelomonas, Gonyostomum, etc.

Class 2: Zoomastigophorea

- Chlorophyll or chromatophores absent.
- Mostly parasitic.
- Reserve food as glycogen.
- Flagella one to many.
- There is an undulating membrane.

Order 1: Choanoflagellida.

Example: Proterospongia.

Order 2: Rhizomastigida.

Examples: Mastigoamoeba, Dimorpha, etc.

Order 3: Hypermastigida.

Examples: Trichonympha, Lophomonas, Leptomonas, etc.

Order 4: Diplomonadida.

Examples: Giardia, Hexamita, etc.

Order 5: Kinetoplastida.

Suborder 1: Bodonina.

Examples: Bodo.

Suborder 2: Trypanosomatina.

Examples: Trypanosoma, Leishmania, etc.

Order 6: Bicosoecida

Examples: Salpingoeca, Poteriodendron, etc.

Order 7: Retortamonadida.

Example: Chilomonas.

Order 8: Oxymonadida.

Example: Oxymonas, Pyrsonympha, etc.

Order 9: Trichomonadida.

Example: *Trichomonas*.

Superclass B: Opalinata

- They have numerous cilia like organelles in oblique rows over the entire body surface.
- There is no cytostome.
- Two or more monomorphic nuclei are present.
- Binary fission is interkinetal.
- There is syngamy with flagellated anisogametes.
- All are parasitic, mainly in frogs and toads.

Examples: Opalina, Protoopalina, Zelleriella, Protozelleriella, and Cepedea.

Superclass C: Sarcodina

- Locomotory organelles are pseudopodia.
- The amoeboid form is predominant.
- Some have a hard shell.
- They generally do not form spores.
- The formation of gametes and flagellated young ones are common.
- Nutrition holozoic or saprozoic.

Class 1: Rhizopodea

- Locomotory organelles are pseudopodia (lobopodian or filopodia but never axopodia).
- They are generally creeping forms.

Subclass a: Lobosia

• Pseudopodia as lobopodian.

Order 1: Amoebida.

Examples: Amoeba, Entamoeba, Pelomyxa, etc.

Order 2: Arcellinida.

Examples: Arcella, Diffugia, Euglypha, etc.

Subclass b: Filosia

• They have tapering and branching filopodia.

Examples: Gromia, Allogromia, Penardia (naked).

Subclass c: Granuloreticulosia

- They have finely granular reticulose rhizopodia (reticulopodia).
- Order 1: Foraminiferida

Examples: Globigerina, Elphidium, etc.

Subclass d: Mycetozoia

- The amoeboid trophic stage develops either into a multicellular aggregation or into a true multinucleate plasmodium.
- The life cycle is complex and has sexual reproduction.
- Usually, sporangia are formed which liberate spores.
- Nutrition is phagocytic.

Example: Plasmodiophora.

Class 2: Actinopodea

- Pseudopodia mainly axopodia with axial filaments, radiating from a spherical body.
- They are primarily sessile or floating forms.
- Gametes are usually flagellated.
- Reproduction is both sexual and asexual.

Subclass a: Radiolaria

- The central capsule is perforated by one to many pores.
- They have spicules or siliceous skeleton.
- Filopodia or axopodia are present.
- The capsule separates the protoplasm into ectoplasm and endoplasm.
- All are marine.

Examples: Thalassicola, Collozoum, Lithocircus, etc.

Subclass b: Acantharia

• Imperforate, non-chitinoid central capsule without pores.

- The anisotropic skeleton of strontium sulfate.
- Axopodia present.
- Marine

Example: Acanthometra.

Subclass c: Heliozoia

- There is no central capsule.
- Rounded body with radiating axopodia.
- Usually naked, if a skeleton is present it is made of siliceous scales and spines.
- They have axopodia or filopodia.
- There may be more than one nucleus, mostly in freshwater.
- Examples: Actinophrys, Actinosphaerium, Clathrulina, etc.

Subclass d: Proteomyxidia

- Largely marine and freshwater parasites of algae and higher plants.
- Filopodia and reticulopodia in some species.

Examples: Vampyrella, Pseudospora, etc.

Class 3: Piroplasmea

• Small, round-shaped or amoeboid parasites in vertebrate red blood cells. Example: *Babesia*.

Subphylum II: Sporozoa

- Locomotory organelles absent.
- Spores usually present.
- Exclusively endoparasites.
- Cilia or flagella may be present in gametes.
- Syngamy takes place after which many spores are formed.
- The spores are simple and contain one to many sporozoites.
- Sporozoites are the infective phase.
- The nucleus is of the single type.

Class I: Telosporea

- Pseudopodia are generally absent.
- Locomotion by gliding or body flexion.
- Spores are formed and there are flagellated microgametes in some.
- Spores are without polar capsules and filaments, naked or encysted.
- Reproduction by both sexual and asexual methods.

Subclass a: Gregarinia

- Mature trophozoites are large and extracellular.
- Reproduction is entirely sexual with sporogony.
- The spores contain eight sporozoites.
- They are parasites of the digestive tract and body cavity of **invertebrates**. Examples: *Gregarina, Monocystis, Nematocystis*, etc.

Subclass b: Coccidia

- Mature trophozoites are small and typically intracellular.
- Each oocyst produces many sporozoites.
- They are parasites of the digestive tract or blood of vertebrates.
- Gametocytes are dimorphic.
- Sporozoites multiply by schizogony in tissue cells.

Examples: Eimeria, Isospora, Plasmodium, etc.

Order 1: Eucoccida

- Schizogony takes place.
- Both sexual and asexual phases take place.
- They are parasitic in epithelial and blood cells of invertebrates and vertebrates.

Suborder 1: Eimeriina

- Macrogamete and microgametocyte develop independently.
- There is no syzygy.
- Macrogametocyte produces many microgametes.
- The zygote is non-motile.
- Oocyst does not increase the size during sporogony.
- Sporozoites are encased in sporocyst.

Example: Eimeria.

- Suborder 2: Haemosporina
 - Macrogamete and microgametocyte develop independently.
 - There is no syzygy.
 - Microgametocyte produces only a few microgametes.
 - Zygote of often motile.
 - Oocyst increases size during sporogony.
 - Sporozoites are naked.
 - Schizogony takes place in vertebrates and sporogony in an invertebrate host.
 - Hemoglobin of host cells forms pigment.

Example: Plasmodium.

Class 2:Toxoplasmea

- Spores are absent.
- There are no flagella or pseudopodia at any stage.
- Reproduction by asexual reproduction (binary fission).
- Cysts are formed which have many naked sporozoites.

Examples: Sarcocystis, Toxoplasma, etc.

Class 3: Haplosporea

- Spores are present.
- Pseudopodia may be present but flagella are absent.
- Reproduction only by an asexual method.
- Schizogony takes place.

Examples: Caelosporidium, Ichthyosporidium, etc.

Subphylum III: cnidospora

- Spores have several cells having one or more polar filaments which are coiled threads and can be shot out, and one or more sarcoplasms or sporoplasms (analogous to sporozoites).
- All are parasitic.
- Zygote gives rise to one or more trophozoites without sporogony.

Class I: Myxosporidea

- Spores are of multicellular origin and large.
- There are one or more sporoplasms with two or three valves.
- They are parasites of fish.

Examples: Myxobolus, Myxidium, Ceratomyxa, etc.

Class II: Microsporidea

- Spores are of unicellular origin and small.
- There is one long tubular polar filament through which the sporoplasms emerges one valve only.
- They are cytozoic (intracellular parasites) in arthropods and vertebrates.

Example: Nosema.

Subphylum IV: Ciliophora

- They possess simple ciliary organelles for locomotion, infraciliature is subpeculiar.
- They have two nuclei, a trophic macronucleus, and a reproductive micronucleus.
- Binary fission is perkinetal.
- Conjugation takes place with the fusion of nuclei, autogamy and cytogamy also occur.
- There are never any free gametes.
- Nutrition is mixotrophic or heterotrophic.
- They usually have a cytostome.

Class I: Ciliata

- They possess cilia or compound ciliary structure as locomotory or food acquiring organelles.
- There is the presence of an infraciliary system, composed of basal granules below the cell surface and interconnected by longitudinal fibrils.
- Most ciliates possess a cell mouth or cytostome.
- Anal aperture (cytopyge) permanent.
- Two types of nuclei, one vegetative (macronucleus) and the other reproductive (micronucleus).
- Fission is transverse.
- Sexual reproduction never involves the formation of free gametes.
- One or more contractile vacuoles present even in marine and parasitic types.

Subclass 1: Holotricha

- Body cilia simple and uniform.
- Buccal cilia mostly absent.

Order 1: Gymnostomatida.

• Examples: *Coleps, Dileptus, Didinium, Prorodon, Nassula*, etc. Order 2: Trichostomatida.

- Examples: Colpoda, Balantidium, etc.
- Order 3: Chonotrichida.

• Examples: *Spirochona, Lobochona, Chilodochona*, etc. Order 4: Apostomatida.

- Example: *Hyalophysa*.
- Order 5: Astomatida.
- Examples: Anoplophyra, Maupasella, Hoplitophyra, etc
- Order 6: Hymenostomatida.
- Examples: *Colpidium, Tetrahymena, Paramecium*, etc. Order 7: Thigmotrichida.
 - Examples: Thigmophyra, Boveria, etc.

Subclass 2: Peritricha

- Adults without body cilia.
- Apical end with buccal cilia.

Order 1: Peritrichida.

• Examples: Vorticella, Carchesium, Trichodina, etc.

Subclass 3: Suctoria

• Sessile and stalked body.

• Young with cilia, and adult with suctorial tentacles.

Order 1: Suctorida.

• Examples: Acineta, Ephelota, Podophyra, etc.

Subclass 4: Spirotrichia

- Reduced body cilia.
- Buccal cilia are well marked.

Order 1: Heterotrichida.

• Examples: Stentor, Bursaria, Spirostomum, Nyctotherus, etc.

Order 2: Oligotrichida.

• Examples: Halteria, Strombidium.

Order 3: Tintinnida.

• Examples: Codonella, Favella, etc.

Order 4: Entodinomorphida.

- Examples: *Entodinium, Cycloposthium*, etc.
- Order 5: Odontostomatida.
 - Example: Saprodinium.

Order 6: Hypotrichida.

• Examples: Euplotes, Stylonychia, Urostyla, Oxytricha, etc.
